China Yunnan Copper finds high grades at Cloncurry North

China Yunnan Copper Australia Ltd has discovered high-grade copper-gold mineralisation at the Cloncurry North project in north-west Queensland during first pass exploration reconnaissance reverse circulation drilling at the Emu, Cobb and Mavis prospects.

All three prospects have not previously been drilled. Results from the Emu prospect in particular indicate a potential increase in grade and width with depth, the company says.

Results include:

19m at 0.21% copper, 0.04g/t gold from 105m including 6m at 0.34% copper, 0.08g/t gold from 105m from the Emu prospect (including 1m at 1.02% Cu, 0.38g/t Au from 106m)

6m at 0.31% copper, 0.04g/t gold from 15m including 5m at 0.36% copper, 0.05g/t gold from 15m from the Cobb prospect.

11m at 0.11% copper, 0.05g/t gold from 89m including 3m at 0.22% copper, 0.04g/t gold from 89m from the Mavis prospect.

Detailed prospect scale mapping is underway on the Mavis prospect, and there are early indications that the mineralisation is more complex than expected, consisting of a series of discontinuous sub-parallel mineralised lenses trending northeast originating from a more structurally complex zone to the southwest of the main shaft.

STOCK DASHBOARD: October 23, 2008
China Yunnan Copper Australia Limited
Closing Price: 9.0c
Price change from previous trading day: -21.7%
Relative Strength (6 months percentile rank): 6.5
Market capitalisation: \$3 million
Turnover volume: 20,000.0
